

John Snyder – jsnyd96

Ryan Milem – gint271

HW5 Documentation

To run our hw5 solution:

1. Extract the tar package with “tar -xzf hw5_gint271_jsnyd96.tar.gz”.
2. Go to the solution folder with “cd ./hw5_final/solution”.
2. Run “make”.
3. Run “./CandyServer filePath portNumber” on a valid json file.
4. Run “./CandyClient hostName portNumber” on another terminal.

The program closely follows the sample solution. Moves are made by selecting a candy on the grid and then clicking one of the arrow buttons on the right. Closing the view will cause the client to exit, but the server will continue waiting for another client to connect. To close the server, type “kill -USR1 serverPID”.
